

Project Objective

لماذا يحتاج تايجر إلى نظام لإدارة طلبات العملاء

Why Tiger needs this system

Today, customer requests arrive by phone, email, and word of mouth, and are tracked in different places, or not tracked at all.

This system gives Tiger **one clear place** to log every request, know who owns it, and see it through to resolution — so customers get faster answers and management gets full visibility.

How the System Works

رحلة الطلب من الاتصال حتى الإغلاق

In plain terms: every request follows the same simple path — no request is lost, and everyone knows where it stands at every step.

Systems Connected

الأنظمة الأربعة التي يعمل معها النظام

The Ticketing System is the hub — it connects the call, the customer record, and the confirmation email into one request.

Users and Responsibilities

من يستخدم النظام وماذا يفعل كل شخص

Customer Service

Creates tickets and follows them until resolved

Department Staff

Works on requests assigned to their department

Department Head / Management

Receives escalations when action is needed

System Administrator

Manages users, access, and system settings

Management Benefits

الفوائد التي يحصل عليها تاجر من النظام

1

One place for all customer requests

2

Clear ownership of every ticket

3

Response-time tracking

4

Automatic escalation

5

Full history of every request

6

Management reports

Delivery Plan

خطة التنفيذ الزمنية للمشروع

Three-Week Internal Pilot

A functional version will be delivered for internal testing within three weeks, developed by one developer with AI-assisted development. Following successful testing and management approval, a separate production-readiness phase will prepare the system for official go-live.

Production go-live requires separate approval

This pilot proves the system works internally. Moving it into live, company-wide use is a separate decision, made only after the pilot is reviewed.

Appendix — Technical Reference (Optional)

For IT / Solution Architect use — not intended for the management audience above.

Architecture

- ASP.NET Core, .NET 10 (LTS)
- Modular monolith — one deployable unit with strict internal module boundaries
- Layers: Web UI, API, Application Modules, Domain, Infrastructure, Integrations, SQL Server

Reliability & Security

- Transactional Outbox + idempotency keys protect every integration call
- ASP.NET Core Identity, JWT authentication, policy-based authorization
- Feature flags gate staged rollout of each integration
